

Target state g_j at each analysis step (frames $1, 11, 21, \ldots$): HIGH if $S_j > \tau_h$ or $T_j > 0.50$ or the recovery probe is active; MEDIUM if $S_j > \tau_m$ or $\ell_j \in \{\text{crowded}, \text{tiny}\}$; LOW otherwise.
Every change needs at least 30 frames since the last change (dwell). Operating point in each box: (resolution r, NMS IoU η, score threshold c).
