
Camera 1
detects and tracks the people in its own view
Camera 2
detects and tracks the people in its own view
Camera 3
detects and tracks the people in its own view
Camera 4
detects and tracks the people in its own view
local tracks with appearance features
Central server
compares the appearance features of the local tracks and decides which tracks of different cameras belong to the same person (person re-identification)
Global identities
one identity for every person across all cameras: paths through the whole site
